

Papua New Guinea

VERSION 1
Date released: 06 March 2018

This report focuses on the most affected areas only. Estimates are based on available evidence to date and may change upon new information becoming available.

Earthquake | February 2018

Geographic impact
On February 26, a magnitude-7.5 earthquake hit Papua New Guinea at a depth of 35 km, with the epicenter about 89 kilometers southwest of Porgera in Enga province. A series of aftershocks, most at magnitude-6 have occurred through March 5th. Severe damage has been caused in 59 LLGs and affecting 23 district in 9 provinces.

Geographical profile

- Epicenter in Hela province, Highlands region
- 9 Provinces, 23 Districts affected (Earthquake intensity 6.0 and above)

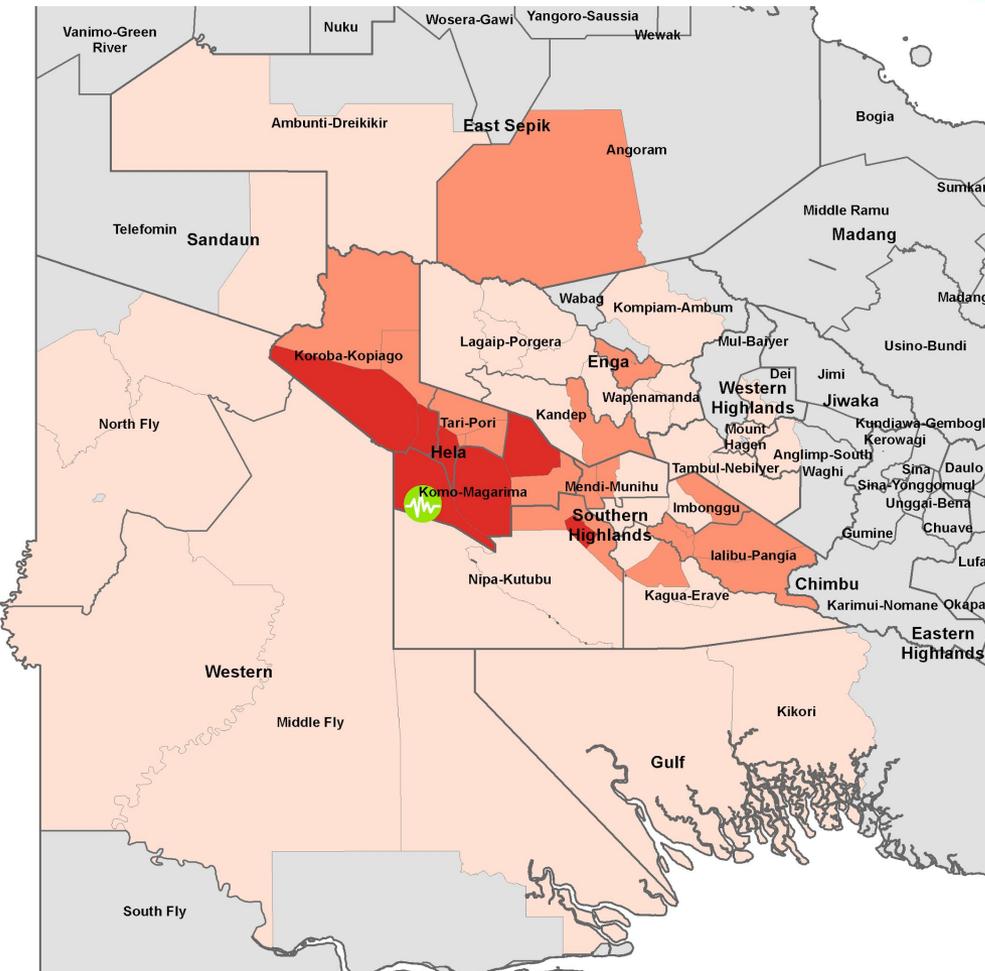

Profile of the affected population

- ~1,560,000 people exposed to extreme disaster in worst impacted LLGs.
- ~681,000 people likely in need of immediate assistance (Priority 1 and 2)
- ~277,000 extremely food insecure people. (Priority 1 and 2)

Livelihood profile

- Subsistence Agriculture is the dominant livelihood
- Livestock rearing Is a key livelihood in some areas
- The area has vast mining concessions with operations by Exxon Mobil, Oil Search, OK Tedi & Barrick Gold Corp

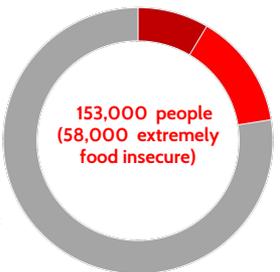

PRIORITY
■ Priority 1
■ Priority 2
■ Close monitoring needed

Priority 1

~153,000 likely in immediate need of humanitarian assistance

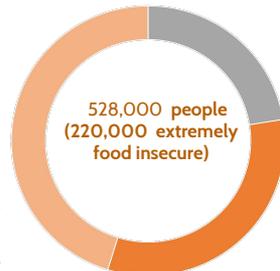

The 7 LLGs within this classification are those where most of the population were hit by intensity 8 and 9 earthquake on the scale of 1 to 10 and experience a high level of food insecurity (>40%). Approximately 153,000 people reside in these areas and need urgent humanitarian assistance. According to the latest WFP mobile VAM (mVAM) food security assessment of December 2017, approximately 58,000 people were already identified as extremely food insecure. The recent earthquake has further compromised food security in these areas.

Priority 2

~528,000 likely in need of humanitarian assistance

Households within this classification reside within 19 LLGs experiencing moderate geographic impact and having a food insecurity prevalence between 20 % and 40% (mVAM, December 2017). Among 528,000 people in these LLGs who are in need of immediate assistance, about 220,000 people were already extremely food insecure. It is highly likely that people from Priority 1 LLGs may start moving into neighbouring LLGs for temporary shelter.

~878,000 likely in need of close monitoring for humanitarian assistance

Households within this classification reside within 33 LLGs struck mainly by intensity 6 earthquake and having a food insecurity prevalence of <10%. Among 878,000 people of these LLGs who need close monitoring for humanitarian assistance, around 231,000 people in these areas were already extremely food insecure.

Note: Numbers on this page are rounded to the nearest thousand.

Data source: 2017 Population Projection based on PNG Census (2011).

HUMANITARIAN NEEDS ESTIMATES

Note: Numbers on this page are rounded to the nearest thousand.

	Priority 1	Priority 2	Priority 3	Total	Assumption
 Male (all age groups)	79,000	272,000	430,000	781,000	The number of male & female are 2017 population projection based on PNG census (2011) and rounded to the nearest thousand. The number of children <5 yrs and infant are results from PNG census 2011.
 Female (all age groups)	74,000	256,000	406,000	736,000	
 Children < 5yrs	27,000	95,000	89,000	211,000	
 Infant	11,000	36,000	42,000	89,000	
 Rice(kg)	428,000	1,478,000	2,340,000	4,246,000	2.8 kg rice weekly/person
 Drinking water (thousand litre)	2,600	9,200	14,600	26,400	17.5 litre drinking water weekly/person
 Clean water (thousand litre)	10,200	35,000	56,000	101,200	67 litre clean water weekly/person
 Toilet	7,600	26,400	41,800	75,800	1 toilet every 20 people

Contextual background

Resilience:

Most of the kaukau crop gardens are in hilly areas - which may be prone to landslides, and sago gardens are in valleys along the river/swamps - which may be prone to flooding.

The earthquake affected areas are prone to erratic rain conditions - either flooding or drought, which affect crop production. Considering the substantial dependency of much of the population on garden-crop agriculture, resilience to cope with adverse shocks, be it climate-related or otherwise, is limited.

Security:

Security is a major issue, mainly linked to inter-tribal conflict. The affected areas are not safe for humanitarian workers without army/police escorts. Also, tribal conflicts may add further challenges to the accessibility of affected areas and make the delivery of humanitarian assistance highly difficult.

Exacerbated food security bears the risk of fuelling violence.

Livelihood profile

Livelihoods:

Garden crop production and livestock keeping are the dominant income generating activities within the earthquake-affected area. mVAM historical livelihood analysis shows that households dependent on livestock-keeping and garden crops as their main source of income are more vulnerable to being severely food insecure than their peers.

WASH, Gender & Protection

Water & Child Health:

According to the most recent mVAM survey, supply of drinking water prior to the earthquake was relatively good, and historical data showed a substantial improvement in community water over the last two years. Similarly, the rate of reported child illness amongst households with children continued to show a gradual decline. However, preliminary IOM field data collection (as of March 1) revealed that potable water was a priority need within affected communities as water contamination has been a direct consequence of the earthquake.

Gender:

Papua New Guinea (PNG) is considered to be one of the most dangerous places in the world to be a woman. An estimated 70 percent of women in Papua New Guinea experience rape or assault in their lifetime, and women in PNG also face systemic discrimination.

Protection:

The risk of tribal fighting and the security of female beneficiaries would need to be considered when planning and implementing humanitarian distributions.

Food security

Food security:

Food insecurity among the affected population is a major concern, in view of the already severe food insecurity and malnutrition levels in some areas before the earthquake hit.

About 37 percent of the population (approximately 58,000 people) of the seven extremely affected LLGs (Priority 1) were estimated to be severely food insecure according to the Food Insecurity Experience Scale (FIES), an official SDG 2 indicator. Four LLGs were deemed as “**food insecurity hotspots**” (with 40% or higher prevalence of households considered to be severely food insecure): **Komo Rural, Nembi Plateau Rural, South Koroba Rural, and Upper Wage LLGs**. Households from **Nembi Plateau Rural, North Koroba Rural, and Upper Wage LLGs** reported facing extreme shortage of food supply (see page 7).

Within the 19 severely affected (Priority 2) LLGs, approximately 42 percent of the population is estimated to be severely food insecure.

Markets

Supply of staple commodities:

According to the latest mVAM data, most of the earthquake-affected areas faced some shortage of supply of staple crops prior to the earthquake; **North Koroba Rural LLG** reportedly faced extreme shortage. These areas experienced substantially above-normal temperatures between August and October 2017, and reported incidence of drought which impacted staple crop production (mainly **kaukau** and **sago** in this part of the country). As Kaukau takes about 8 months to harvest, supplies are expected to remain very constrained.

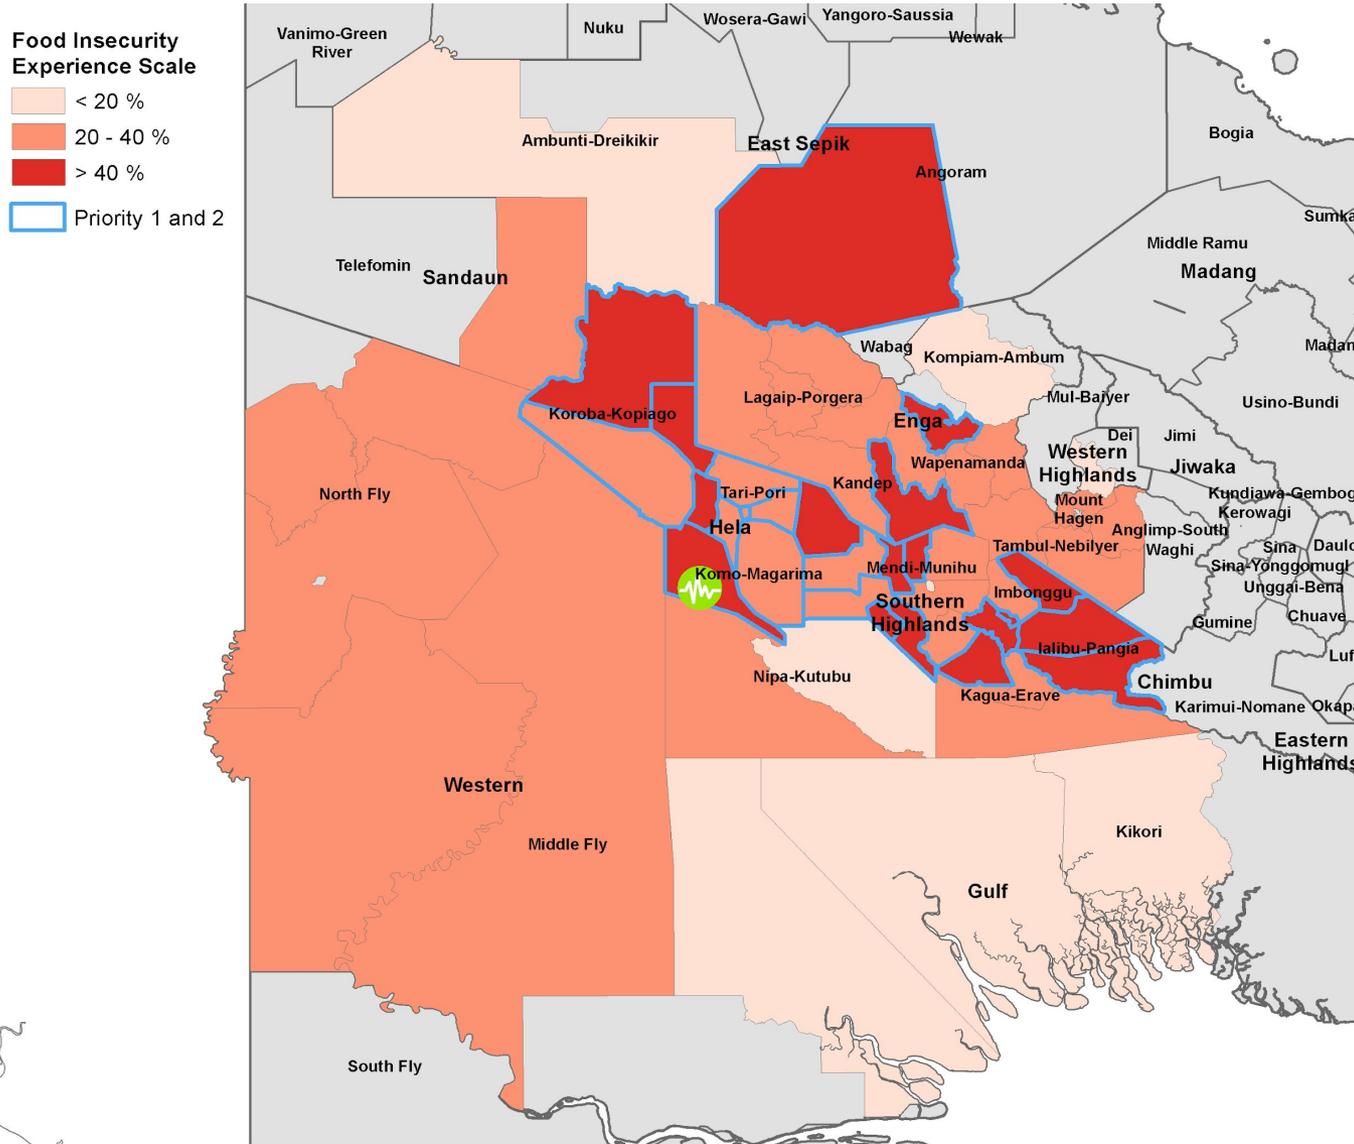

Prices of staple commodities:

Within the Priority 1 LLGs, in December 2017 the average price of kaukau was about 2.8 KPG/unit, and the price of sago was reported at 3 KPG/unit in Lake Kutubu Rural LLG. In North Koroba Rural LLG, where an extreme shortage of kaukau supply was reported, the average price was nearly double the average at 5 KPG/unit.

Meanwhile the average price of rice was about 5.70 KPG/kilo, which is in line with the national median reported price of rice, which has remained stable at around 5PGK per kilo for nearly the past two years.

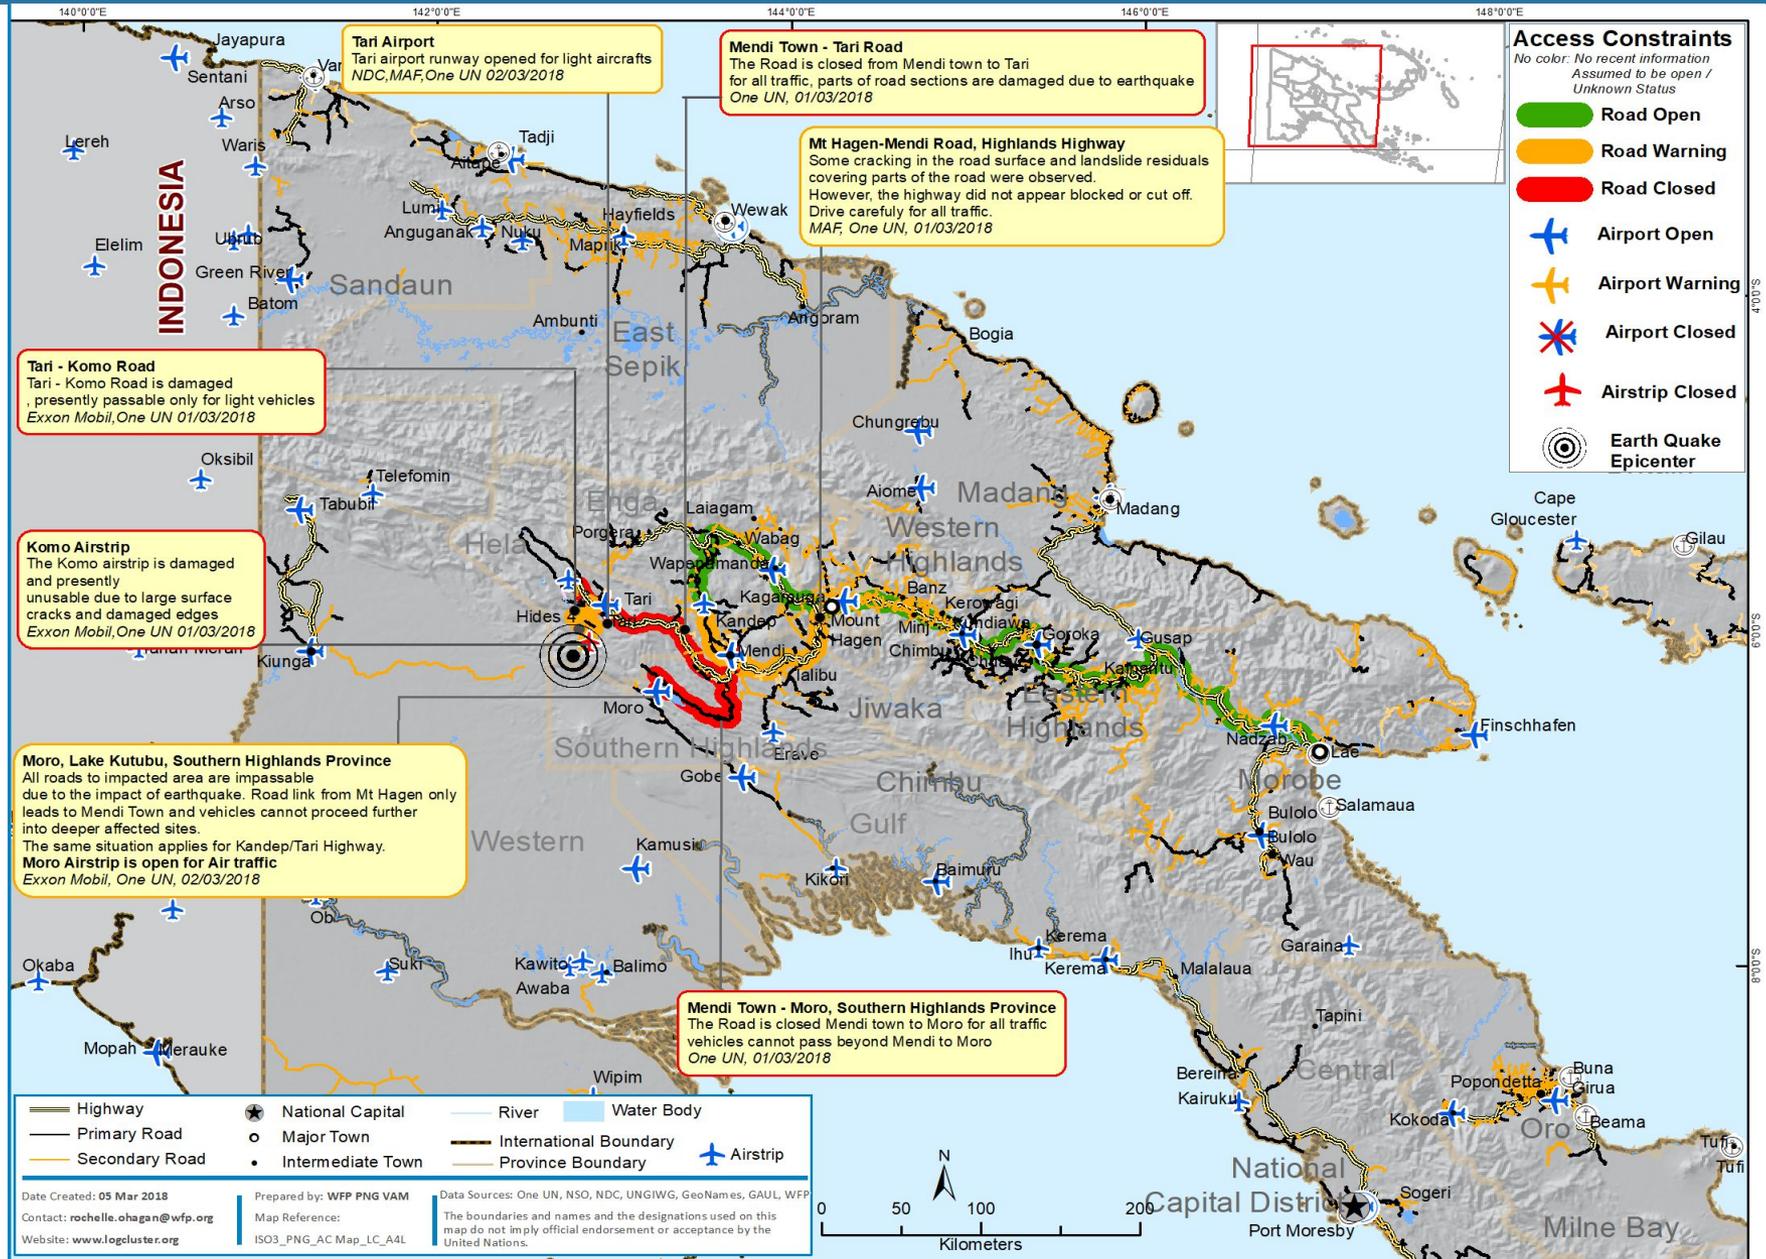

SUPPLEMENTARY INFORMATION-Food insecurity

Food Insecurity: % of population in affected LLGs estimated to be severely food insecure (FIES)

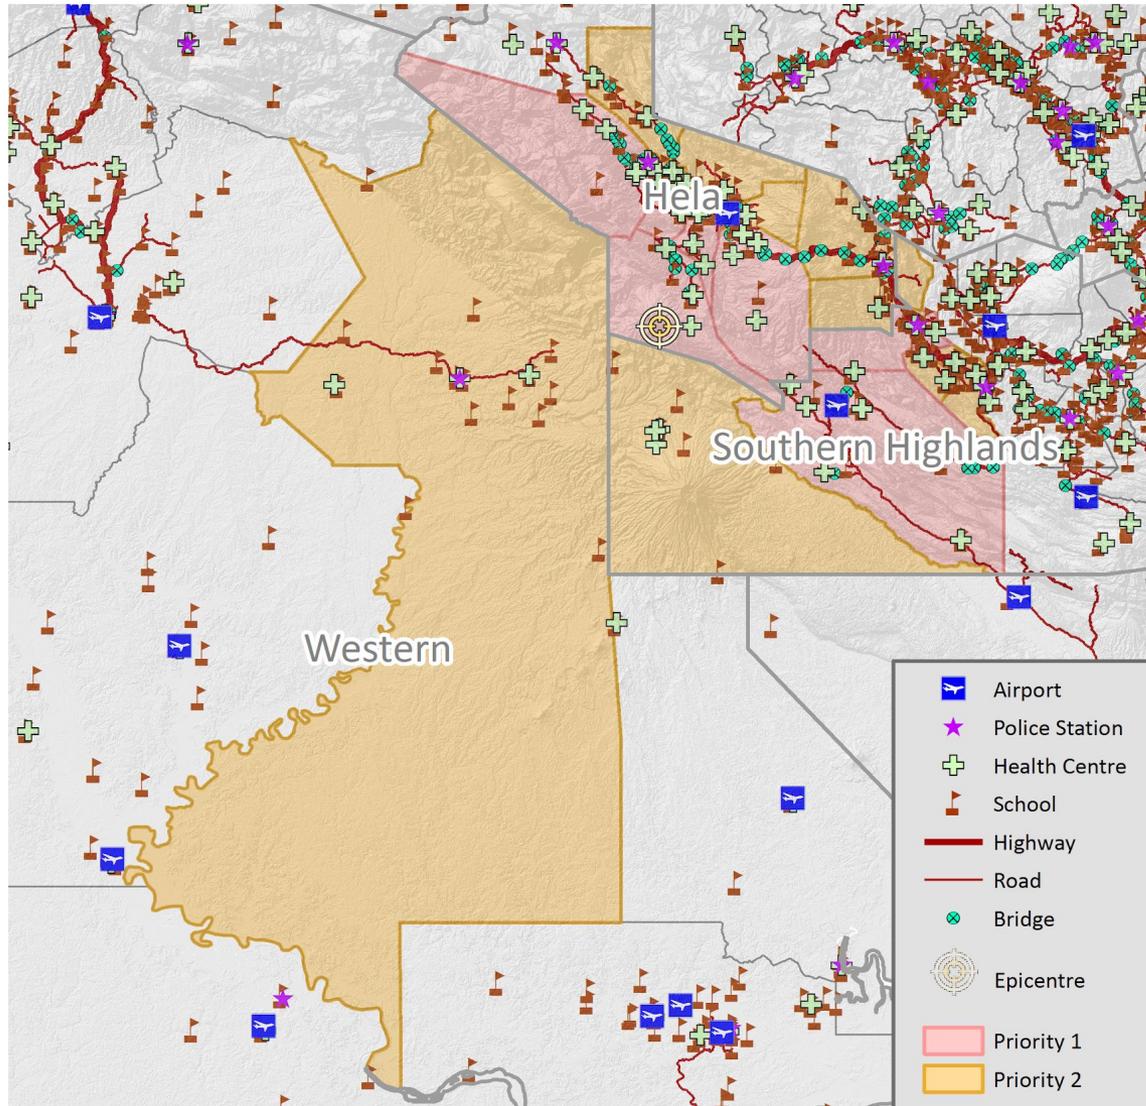

Data Source: mVAM survey, February 2018

SUPPLEMENTARY INFORMATION-Access Constraints as of Mar.5

SUPPLEMENTARY INFORMATION-Infrastructure

Infrastructure : Location of airports, police stations, health centres and schools in affected LLGs

Data Source: WFP / Spatial Database Infrastructure

*Designates that the LLG is considered to be a "food insecurity hotspot" as according to mVAM December 2017 data

ADDITIONAL INFORMATION

? ASSUMPTIONS

Geographic impact: Shakemaps of earthquake ground shaking are produced by the United States Geological Survey (USGS) and used by the World Food Programme to produce overall impact assessments since the main earthquake happened. The geographic impact of one LLG is decided by the MMI level of the areas where majority or the largest proportion of the population reside.

Priority areas: The classification of priority areas for this version are a result of overlaying geo-analysis of disaster impact and Food Insecurity Experience Scale, as the representative vulnerability indicator at LLG level. The classification matrix is as below:

Earthquake MMI	Food Insecurity Experience Scale (FIES)		
	<20%	20%-40%	>40%
6.0			Priority 2
7.0		Priority 2	Priority 1
8 & above	Priority 2	Priority 1	Priority 1

Needs estimate: In this analysis, the InaSAFE model is adopted to make initial estimates on minimal humanitarian needs. For the InaSAFE model the following assumptions were used to calculate the needs for the estimated severely affected population:

- Each person should be provided with 2.8 kg of rice weekly;
- Each person should be provided with 17.5 liters of drinking water weekly;
- Each person should be provided with 67 liters of clean water weekly;
- A toilet should be provided for 20 every persons;

The estimates serve as a reference to understand the scale of needs on the ground. The unit need per person should be customized by national decision-makers.
