Issue No. 30
April 2020

Iraq Market Monitor Report

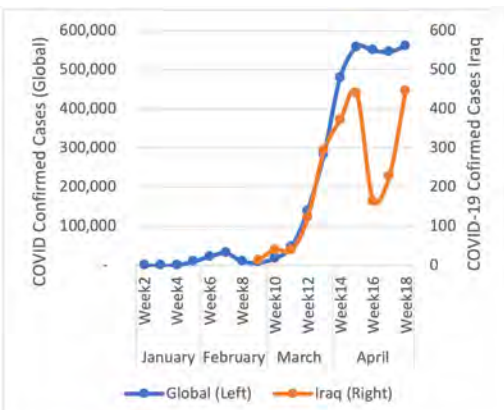

Highlights

- Mitigation measures such as curfew and lockdown are negatively impacting the employability of daily casual labor as well as low income workers.
- Losing a job or the disruption of livelihood sources are the primary concerns among households.
- After a price hike observed in March, prices mostly remained stable during April.
- Oil-based revenue fell from US \$6.2 billion in January to US \$1.4 billion in April. If oil prices are not restored, this loss of revenue might impact the implementation of social safety nets.

During April, the global impact of the COVID-19 pandemic continued to worsen. The total confirmed cases crossed the three million mark, with 75% diagnosed only during April. Although social distancing and mitigation measures have plateaued the curve over the past few weeks, more than 500,000 cases are still being reported globally every week.

COVID-19 mitigation measures. The most impacted economic activities are those that rely on daily casual labour. Losing a job or the disruption of livelihood sources are among the primary concerns of the households interviewed through WFP's mobile Vulnerability Analysis and Mapping (mVAM) during April.¹

In Iraq the total cases surpassed 2,000 on 30 April, while 92 people have died of the pandemic to date. There was a temporary dip in the weekly confirmed cases during week 16, when 440 cases per week dropped to 163. However, as the government eased the curfew and lockdown measures, the numbers jumped again to 445 new cases during week 18.

COVID-19 weekly confirmed cases globally

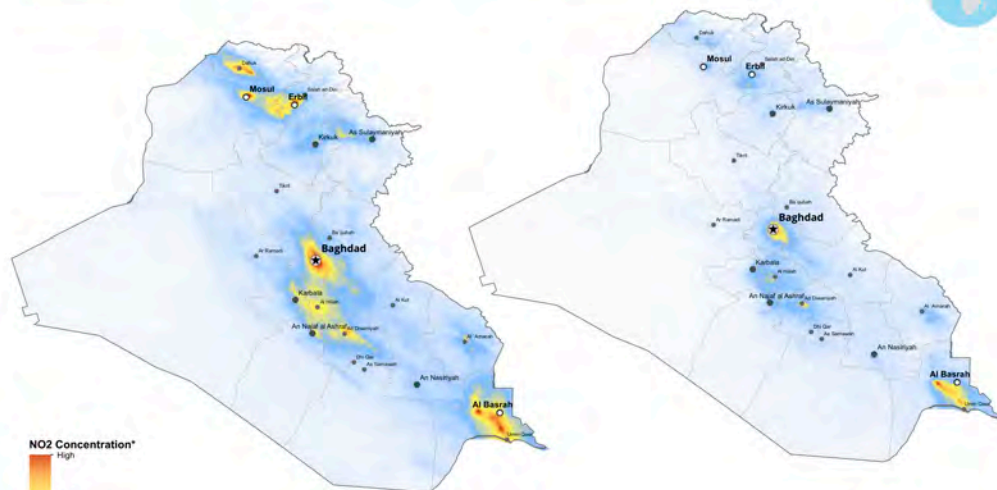

As confirmed by the air pollution map below, the economic activities in the country continue to shrink further amid

IRAQ: COVID-19 - Concentration of Nitrogen di Oxide (NO2): Mar Vs Apr 2020

March - 2020

April - 2020

* Nitrogen dioxide (NO₂) is an important trace gas in the Earth's atmosphere. It is associated with anthropogenic activities (notably fossil fuel combustion and biomass burning for industrial activities). In this analysis it is used as a proxy of human activities impacted because of COVID-19. Sentinel5P satellite based total vertical column of NO₂ (ratio of the slant column density of NO₂ and the total air mass factor) is used and the unit of measurement is Molecules per meter

¹ Other concerns include extended lockdown, shortage of food, increased food prices, disruption of medical services, disruption of educational institution, and more.

As the pandemic slows down the economic activities in the country, this combined with the reduction in global oil prices risks reversing the economic gains of the previous year. After two consecutive years of contraction, real GDP grew 4.4% in 2019 with a major contribution from the oil sector 4.2% year-on-year (y/y).² Corona mitigations globally are negatively impacting upon the oil-based sector of the economy. An estimate shows that the global oil demand dropped by 30 million barrels per day³ (an estimated 30% decrease).⁴

The Organization of Petroleum Exporting Countries (OPEC+) agreed to cut global oil production by 9.7 million barrels per day (around 10% of daily global production) during the months of May and June. Iraq is among the top oil producing OPEC+ member countries, and agreed to cut its production by one million barrels per day in the coming months.⁵

Oil revenues accounts for more than 90% of the annual Iraqi budget. Monthly revenue from oil dropped from US\$6.2 billion in January⁶ to US\$1.42 billion in April.⁷ Estimates say that the situation might result in a budget deficit of around US\$42 billion where the - yet to be approved - budget is estimated at around US\$135 billion. If oil prices do not adequately recover,⁸ this deficit could double.

The management of the supply side has begun to yield results and after a month of negative fluctuations in the oil markets, Basra Heavy recorded a 32% increase in the last week of April (from US \$18.68 on 28 April to US\$24.68 on 1 May).⁹

The non-oil economy of Iraq grew 4.9% during 2019, with agriculture the largest contributor to the growth of the non-oil sector, with an expansion of 39% during 2019. The last cropping season (2018-19) reported a record cereal production of 6.4 million tonnes (MT), a 60% increase in wheat production. According to United States Department of Agriculture, the wheat production during 2019 was 4.8 MT. Projections for this year also indicate an above-average harvest of around 4.7 MT of cereal crops. In addition to local production, Iraq also imports wheat and rice. The cereal import requirement for 2019-20 is 4.2 MT including 2.7 MT of wheat flour and 1.3 MT of rice. This is 20% lower, when compared to the import requirements of the previous year, because of the strong harvest.

Service sectors, such as trade, transport, financial sector and religious tourism, which constitute almost half of the non-oil economy, will continue to be the hardest hit. Religious tourism in the southern governorates is often reported as the second largest source of revenue after oil. In normal times, income from pilgrims creates jobs for hundreds of thousands of Iraqis and brings in billions of dollars per year. The city of Najaf used to host around 5,000 visitors per day, but now 300 out of 350 hotels are closed.¹⁰

Market Functionality

WFP's Market Functionality Index (MFI) supports the “market assessment and risk identification” and “market situation monitoring” processes of cash-based assistance operations.

On a scale of 0 to 10, the full package analyses nine different dimensions of a market, to help make informed transfer modality decisions and detect changes in market functionality over time. The MFI reduced version for assessment over the phone analyses four of these dimensions (skipping the observational dimensions). The analysis of WFP's mVAM data on Market Functionality Index (MFI) – Beta,¹¹ revealed that during April, markets selling food items were generally functional across the country. The availability and resilience pillars of MFI demonstrated higher scores (8 and 10 respectively), when compared to multisector assortment (3) and prices (4). Maysan, Sulaymaniyah and Kirkuk markets recorded a lower average MFI score.

Multisectoral Assortments: The assortment of essential goods dimension refers to essential goods that households require, to ensure minimum living standards without resorting to negative coping mechanisms or compromising health, dignity or crucial livelihood assets. These include food, shelter, basic household items, safe drinking water, sanitation and hygiene (WASH) or healthcare. Since only essential businesses (e.g. food, pharmacy) were open during lockdown, the assortment of cereals and other food items were good in the markets across the country, however the assortment for non-food items reported low scores. The lowest assortment score was observed in Qadissiya market.

Availability: The availability pillar refers to the physical presence of goods in the market in sufficient quantities. It assesses whether certain products are scarce, or likely to get scarcer in the short run. Out of a maximum of 10, the average availability score at the national level is 8.5. Maysan (5), Kerbala (5) and Sulaymaniyah (5.8) recorded lower availability scores.

Prices: The price dimension of the MFI measures two basic features of prices, i.e. trend or level, and volatility or stability. The first is associated with affordability (how the prices changed as compared to the previous month) and the second with stability and predictability (if the retailers can predict prices of the items they sell, for the next week). Both rising prices and excessive volatility show that the market is not functioning well.

Markets in Erbil, Babil, Muthanna, Najaf, Salah al-Din, Kerbala, Ninewa and Diyala governorates reported high price changes over the past month, with good predictability in prices.

However, the trend seems to be the opposite in the markets in Baghdad, Qadissiya, Thi-Qar, Basra and Wassit, where month-on-month (m/m) prices did not change significantly, but the traders feel they cannot meaningfully predict the prices of items they are selling in the following week, indicating some volatility. Duhok reported a good score for the price dimension, with no significant prices changes over the past month, and good predictability. Anbar, Sulaymaniyah, Maysan and Kirkuk reported the lowest score for both dimensions.

Resilience: The supply chain resilience dimension evaluates both responsiveness and vulnerability of supply chains. Resilient supply chains underpin the regular supply of a market, which receives and stocks goods despite potential disruptions - essential for a well-functioning market. All markets across Iraq demonstrated a very good resilience score. All reported enough stocks for at least one week, and they were also confident of replenishing their stocks within one week.

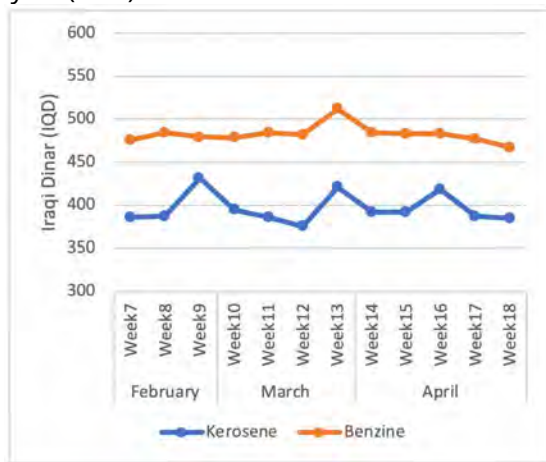

¹¹ <https://www.wfp.org/publications/market-functionality-index-mfi>

Price Trend of Hygiene Items

From the six hygiene items that WFP is currently monitoring, m/m increases in the national average price levels were observed in toothpaste (14%), disinfectant liquid (13%), toothbrushes (9%), soap (8%) and shampoo (7%). The highest m/m increases in hygiene items were observed in Kirkuk, Salah-al-Din, Diyala and Baghdad respectively. The price of soap increased in Wassit (38%), Muthanna (17%), Salah al-Din (17%) and Duhok (8%).

Fuel Price Trend

The m/m comparison indicates that fuel prices at the national level are stable, however kerosene prices increased from IQD 340 to IQD 395 when compared with the average price last year for the same month. The highest m/m increases in kerosene prices were observed in Anbar (25%) and Diyala (20%).

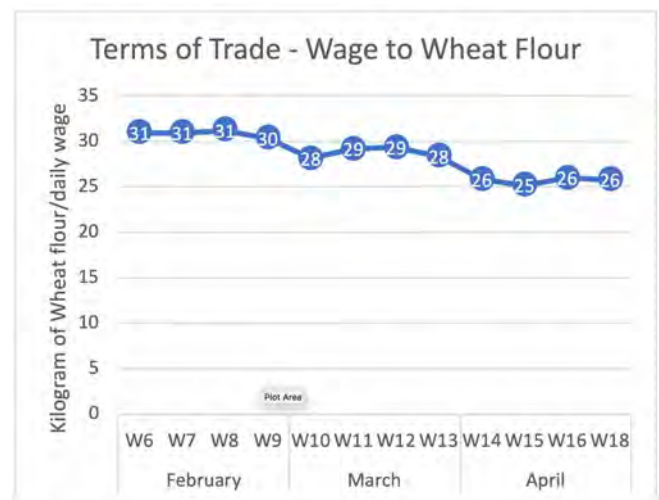

Unskilled Labor & Terms of Trade

Terms of Trade (ToT) is a direct measure of food access. It measures how much of a given commodity (wheat flour in this case) a person's unskilled wage can buy. Temporal trends of ToT can provide a good proxy for deterioration in the purchasing power of vulnerable people.

Along with the prices of essential commodities, WFP continues to monitor the unskilled wage rates in Iraq. COVID-19 mitigation measures such as curfew and lockdown are negatively impacting the employability of daily casual labor as well as low income workers.

Increasing prices hinder the ability of a person to buy enough food for the family at a given wage rate. The graph on the right shows a clear negative trend over the past three months. Where before COVID-19, a daily wage could buy 31kg of wheat flour, this has now dropped to 26kg. The wage rate of unskilled labor decreased significantly in Kirkuk (-50%), Diyala (-14%) and Anbar (-10%). No change (m/m) was observed in other governorates.

Amid COVID-19, increasing prices and declining wage rates hinder the ability of a person to earn enough money to buy the food required to feed their family.

Methodology

Market price information is collected for 33 different items, on a weekly basis from all governorates in Iraq. This includes 23 food commodities, 3 types of fuel, 6 hygiene items and the wage rate of unskilled daily laborers. WFP's field monitor team collects this data from 8 governorates with a WFP presence on the ground, while the other 10 governorates are covered with the help of a third party.

Data is collected through face-to-face interviews with retailers, using a standardized smartphone application connected to a WFP server. With the COVID-19 movement restrictions, price data is now being collected through phone calls to retailers.

To understand the impact of COVID-19 pandemic on food security and market functionality, WFP activated the "mVAM" system of monitoring food security and market functionality indicators through phone calls. Statistically significant data at the governorate level is collected every week on market functionality indicators, including multisector assortment, prices (level and stability), availability (scarcity and runout) and market resilience. The data is collected from retailers from all over the country.

The system is initially in place for three months to monitor the effect of COVID-19 on food security and market functionality, however, subject to funds, this could further expand and form part of a bigger Food Security Monitoring System (FSMS).

WFP's Vulnerability Analysis team ensures the quality of data on a weekly basis, analyzing and producing monthly reports. The data is also accessible through WFP's regional as well as global data platforms:

W4 Price refers to the price during the 4th week of April. **1W** compares the 4th week with the 3rd week of the same month. **4W** compares the 4th week of the current month to the 4th week of previous month. **1M** compares the average price of current month to the average price of the previous month. **1Y** compares the average price of the current month to the same month last year.

Percent price decreases beyond the defined threshold (-5%) are highlighted with a **green dot**, while percent price increases beyond the defined threshold (5%) are highlighted with a **red dot**. Changes within 'normal' values (±5%) are represented with a **yellow dot** and represent price stability.

W4 Price refers to the price during the 4th week of April. **1W** compares the 4th week with the 3rd week of the same month. **4W** compares the 4th week of the current month to the 4th week of previous month. **1M** compares the average price of current month to the average price of the previous month. **1Y** compares the average price of the current month to the same month last year.

Percent price decreases beyond the defined threshold (-5%) are highlighted with a **green dot**, while percent price increases beyond the defined threshold (5%) are highlighted with a **red dot**. Changes within 'normal' values (±5%) are represented with a **yellow dot** and represent price stability.
